WW2 – M3U3 Midterms Assignment

1. I would use Device Manager to find and troubleshoot the device. It is useful because it lets me view the computer's hardware, check its drivers, and uninstall or reinstall a device when needed.
2. I would access the printer's settings by going to Settings > Bluetooth & devices > Printers & scanners. I would need the printer's IP address if it is a network printer, because its settings can also be accessed through a web browser using its IP address.
3. I would select Extend in the display settings. This allows me to use the two monitors as separate screens, so I can put the web browser on one monitor and the document on the other.
4. I would check the labels or colors of the audio jacks. The pink jack is normally for a microphone, while the lime jack is for speakers and the light blue jack is for line-in.
5. I would go to the printer's settings or printing preferences and look for the option for two-sided or duplex printing. I would turn it on so that the printer prints on both sides of the paper by default.
6. The feature is called OCR (Optical Character Recognition). It can recognize text from a scanned image and turn it into editable text. One advantage is that I can edit and search the text instead of typing everything manually. A disadvantage is that OCR can sometimes make mistakes, especially if the scanned document is blurry or has unusual fonts.

7. The fuser unit is most likely causing the problem because a laser printer uses the fuser to properly bond the toner to the paper. If the fuser is damaged or not working correctly, the pages can become smudged. I would check or replace the fuser and make sure the printer is clean and working properly.
8. A typical color printer uses four ink colors: Cyan, Magenta, Yellow, and Black (CMYK). The printer mixes different amounts of these colors to create many other colors for the brochure.
9. I would go to Settings > Bluetooth & devices > Printers & scanners and check if the wireless printer appears there. I could also check the printer properties or print a test page to see if the computer can communicate with it. If the printer is not working, I would check the driver because Windows normally uses Plug-and-Play to detect the printer and install the correct driver.
