Section: BSIT-102I

Course: ITC-C103

1. The Microsoft Store is easy and safe to use because apps are checked by Microsoft. Desktop installers have more app choices but need to be downloaded from trusted websites. I would use the Microsoft Store for simple apps and desktop installers for programs not available in the Store.
2. Task Manager helps monitor running apps and the computer's performance. It can also close apps that are frozen or not responding. This helps make the computer work better.
3. HDDs have more storage but are slower. SSDs are much faster and more reliable. Cloud storage lets you access files online. I would choose an SSD because it makes the computer faster.
4. Updates help keep the computer secure and running smoothly. If you ignore updates, your computer may become slow or vulnerable to viruses.
5. Organizing files into folders makes them easier to find. Backing up files protects them from being lost. If my laptop stopped working, I could still recover my school files from a backup.
6. If a program keeps crashing, the **cause** could be a software problem. The **symptom** is that the app suddenly closes. The **consequence** is losing unsaved work.
7. My computer became slow once, so I restarted it and closed extra apps. It worked better after that. If it didn't, I would ask for technical support.
8. I think built-in help is best for beginners because it is simple and reliable. Community groups are also helpful, but some answers may be incorrect.
9. I would search: "**Windows 11 blue screen CRITICAL PROCESS DIED fix.**" This includes the operating system, the problem, the error code, and the word "fix" to get better results.
10. A company may use a temporary fix so employees can continue working right away. However, if they don't solve the real problem, it may happen again and cause bigger issues later.
