

ITCC103 (IT Fundamentals)
Week 1 Assignment

M1-U1 (Common Computing Devices)

Name: Strawberry Shortcake

Date: July 18, 2026

Subject Code-Section: ITCC103-102I

Name Members (Present/Contributed):

- Garcia, Marina Ellise V.

1. Computing has changed a lot from the **Mainframe era** to **today's Ubiquitous and AI era**. Before, only large companies and governments used computers. Now, almost everyone has a smartphone or laptop. In my experience, I use my phone every day for studying, chatting, and accessing files online.
2. In my own opinion, one industry that IT has greatly improved is **healthcare**. Hospitals use computers to store patient records, schedule appointments, and even offer online consultations. This makes healthcare faster and more convenient.
3. A desktop computer is made for one person's **daily tasks like studying, gaming, or editing**. A server is built to provide **services and data to many users over a network**. I would use a desktop for schoolwork and gaming, while a server is better for businesses that need to share files or host websites.
4. A modern computing device like a **Smartphone**. The **Input** is like tapping the screen or using the camera, **Processing** is the CPU that processes the data, the **Output** is the screen displays the result or the speaker plays sound, lastly the **Storage** is the Photos, apps, and files are saved in the phone's memory or cloud storage.
5. The **Desktops** are easier to upgrade and customize because you can replace parts like the RAM or graphics card. Laptops are better if you need portability. If it were me, I would choose a desktop for gaming or video editing, but a laptop for school because I can bring it anywhere.
6. The **IoT (Internet of Things)** is a network of smart devices connected to the internet, like smart TVs, smartwatches, and smart lights. Unlike a traditional computer network, IoT connects everyday objects. It makes life easier but also raises privacy and security concerns.
7. The **UI** is how users interact with a device. A **GUI** uses icons, windows, and buttons, while a **CLI** uses text commands. GUI is easier for most people, while CLI is faster for advanced users.
8. As a student, I would choose a **2-in-1 laptop** because I can use it as both a laptop and a tablet for taking notes and doing assignments.

9. An **on-premise server** is owned and managed by the company, while a **cloud server** is hosted online by a provider. On-premise gives more control but costs more. Cloud servers are easier to scale and access from anywhere but require internet access.

10. Computers use binary (1s and 0s) because transistors inside the computer only have two states: **on** and **off**. Everything we use, like text, pictures, music, and videos, is stored and processed using these binary numbers.
