

ITC C103
WW2 - M3U3 Midterms Assignment 9

Francisco, Sean Gabriel
Nacionales, Chevelle
BSIT - 1021

Answers and Questions:

1. You are an IT support technician trying to fix a problem with a user's computer. They have a device that isn't working correctly and doesn't show up in the main Settings app. What advanced Windows tool would you use to find and troubleshoot the device, and why is it useful?

Answer: Use Device Manager (devmgmt.msc) it shows all hardware including problem devices that Settings hides, with warnings marking driver issues.

2. Your manager is asking you to configure a new smart printer on the office network. The printer needs to be accessible to everyone in the office. How would you access the printer's settings, and what information would you need?

Answer: Find the printer's IP address on its control panel or network config page, enter it in a browser to access the web interface, then log in with default credentials. You'll need the network password and IP configuration preference (DHCP or static).

3. You're setting up a new computer with a dual-monitor setup. You want to have a web browser open on one screen and a document open on the other to work on them at the same time. What display option would you select in your display settings? Explain your answer.

Answer: Select "Extend" in Display Settings to use both monitors as one continuous workspace for multitasking.

4. You need to record a podcast with an external microphone on a desktop computer. The computer has several different audio jacks. How would you determine which jack to plug the microphone into?

Answer: Look for the pink/red microphone symbol on the computer. Test by checking Sound settings input levels when you plug in the mic to confirm which jack registers activity.

5. You are printing a 100-page report for a meeting. To save paper, you want to print on both sides of each sheet by default. Where would you go in the printer's settings to change this option?

Answer: Go to Control Panel, Devices and Printers, right-click printer, Printer Properties, "Finishing" or "Paper Handling" tab, and enable "Print on Both Sides."

6. You have just scanned a document, but the file is an image, not a text document you can edit. What is the name of the feature or technology in the scanner software that would allow you to convert the image of the text into a document you can edit? Name some advantages and disadvantages of such a feature?

Answer: This is the technology that converts scanned image text into editable text. Advantages include saving time on retyping, making text searchable and editable, and easier archiving. Disadvantages include imperfect accuracy (especially with poor scans, handwriting, or unusual fonts) and the need for proofreading and correction, plus trouble with complex layouts like tables.

7. A user's laser printer is creating smudged pages. Which component inside the printer is most likely causing this issue? What solution/s is/are needed to solve the problem?

Answer: The most likely cause is the fuser unit, which melts and bonds toner onto the paper. If it's worn, dirty, or malfunctioning, toner won't fully fuse and will smear. The solution is to clean or replace the fuser unit, check the toner cartridge for leaks or damage, and make sure the correct paper type and settings are being used.

8. You are a graphic designer and need to print a high-quality color brochure. A regular black and white document uses just one ink color. How many different ink colors would a typical printer use to produce your full-color design? How is this possible?

Answer: A typical color printer uses 4 ink colors: Cyan, Magenta, Yellow, and Black (CMYK). These inks are combined in different proportions to produce the full range of colors seen in a printed design, a process called four-color printing.

9. A friend is asking for your help because their new wireless printer isn't working. How can you perform a basic test in Windows to check if the computer is communicating with the printer and if the necessary driver is installed correctly?

Answer: Go to Settings > Devices > Printers & Scanners, find the printer, right-click it, and select Printer Properties, then click Print Test Page. If it prints successfully, the computer, driver, and printer are communicating properly. If it fails, check the Wi-Fi connection, restart the printer and computer, or reinstall/update the printer driver.
